

Orbits and Climate Oscillations: Illustrated Science

Filesize: 1.57 MB

Reviews

Merely no words to clarify. I could comprehend every little thing using this created e pdf. I am just effortlessly could possibly get a enjoyment of reading through a created publication.
(Mr. Ari Powlowski)

ORBITS AND CLIMATE OSCILLATIONS: ILLUSTRATED SCIENCE

To read **Orbits and Climate Oscillations: Illustrated Science** PDF, remember to click the web link beneath and download the ebook or have accessibility to other information which are in conjunction with ORBITS AND CLIMATE OSCILLATIONS: ILLUSTRATED SCIENCE book.

Createspace Independent Publishing Platform, United States, 2016. Paperback. Book Condition: New. Illustrated. 229 x 152 mm. Language: English . Brand New Book ***** Print on Demand *****.The orbit of the Earth around the Sun, and the orientation of the Earth's spin axis, oscillates slightly in intervals of 26,000, 41,000, and 100,000 years. These cycles, termed the Milankovitch Cycles, were once deemed to be the cause for the Ice Age cycles. This perception no longer holds true. Evidence exists that the orbit of the Earth and the planets is actively maintained by the electrodynamic effects of the Primer Fields that focus interstellar plasma onto our Sun, in times when they are active. The orbital characteristics stand as an item of proof that our Sun is an externally powered plasma star, instead of a sphere of hydrogen gas that is internally powered by nuclear fusion. The externally powered Sun is able to pull the Earth's climate periodically out of the Ice Age condition that has been the normal state for the last 2 million years. The Primer Fields are subject to on-off conditions, depending on conditions in interstellar space. Ice Ages result in the off periods. The on periods cause the warm interglacial climate, such as we have now, and the Dansgaard Oeschger oscillations that periodically rewarm the Earth during the glacial periods. During the inactive state, the solar activity is reduced to a type of cosmic default level with 70 less radiated energy. At the present rate of diminishment, the solar activity phase-shift threshold to the next Ice Age period may be crossed in 30 years, or in the 2050s, most likely. With the primer system gone inactive, the climate on Earth will get 40 times colder than the Little Ice Age in the 1600s had been. Ice core evidence promises...
