P, but on a greater number of days there were losses of phosphorus greater in magnitude than the previously mentioned storage. We must conclude therefore, that under his conditions 0.861 gm. P was an insufficient amount. The calcium balances were negative, and the nitrogen balances positive. R. Tigerstedt (1911) studied the composition of the freelychosen food consumed by 64 persons ranging in age from 2 years to maturity. Some of his results are set forth in the following table.
