This increase in shunt-field resistance causes a decrease in the field current and, hence, a decrease in the strength of the magnetic field in which the armature is rotating. This will result in a decrease in the voltage generated in the armature of the electrical unit, which will cause a reduction in the value of the current being delivered. When the current drops below a certain value the contacts will close and the output will increase in value. This cycle of operations will be repeated many times a minute, and the current actually will remain practically constant in value. Third Brush Regulation The output of practically all the electrical units, when operating as a generator, that were put out by the Delco company during 1916 and since, are regulated by the third-brush method. The construction of the electrical units for the different installations is practically the same. The chief difference is in the wiring and type of combination switch. The majority of the installations use a push-button type of switch with four push buttons instead of five. Front views of two different four-button switches are shown in Figs. 185 and 186. The only difference in the two switches is that an ammeter is provided on one and there is none on the other. The operation of this switch is practically the same as the operation of the five-button type except that a single ignition button is used and...
